

sql-definitions

SQL Definitions

Module Overview

This module does not directly use SQL databases for its core functionality.

Database Usage

Primary Storage

- **Technology:** In-memory challenge registry, filesystem storage for scripts
- **Purpose:** Challenge execution, assertion validation, reporting, monitoring, metrics
- **Schema:** No SQL schema is required

Optional SQL Integration

- Challenge results and metrics can be stored in SQL databases for long-term analysis
- User flow test results may be persisted to SQL for trend analysis
- Assertion engine evaluations can be logged to SQL audit tables
- Plugin system v2.0.0 metadata may be stored in SQL

Related Modules

For SQL database functionality, see the [Database module](#).

Migration Notes

If SQL support is added in the future:

1. Create migration scripts in migrations/ directory
2. Follow versioned migration pattern (001_initial.sql, 002_add_feature.sql)
3. Use the `digital.vasic.database` module for database operations
4. Update this document with schema definitions
